

**Supplementary Table S1.** Results from sensitivity MR analysis on the relationship between the proportion of indigenous American Mapuche ancestry as investigated exposure, and GBC, gallstone disease and BMI as outcomes of interest. Cochran's Q statistic *p*-values higher than 0.05 are suggestive of no instrument heterogeneity as a proxy for pleiotropy, and MR-Egger intercept *p*-values higher than 0.05 are consistent with no horizontal pleiotropy. Results including Steiger filtering and obtained using alternative thresholds for LD pruning and PheWAS are also shown.

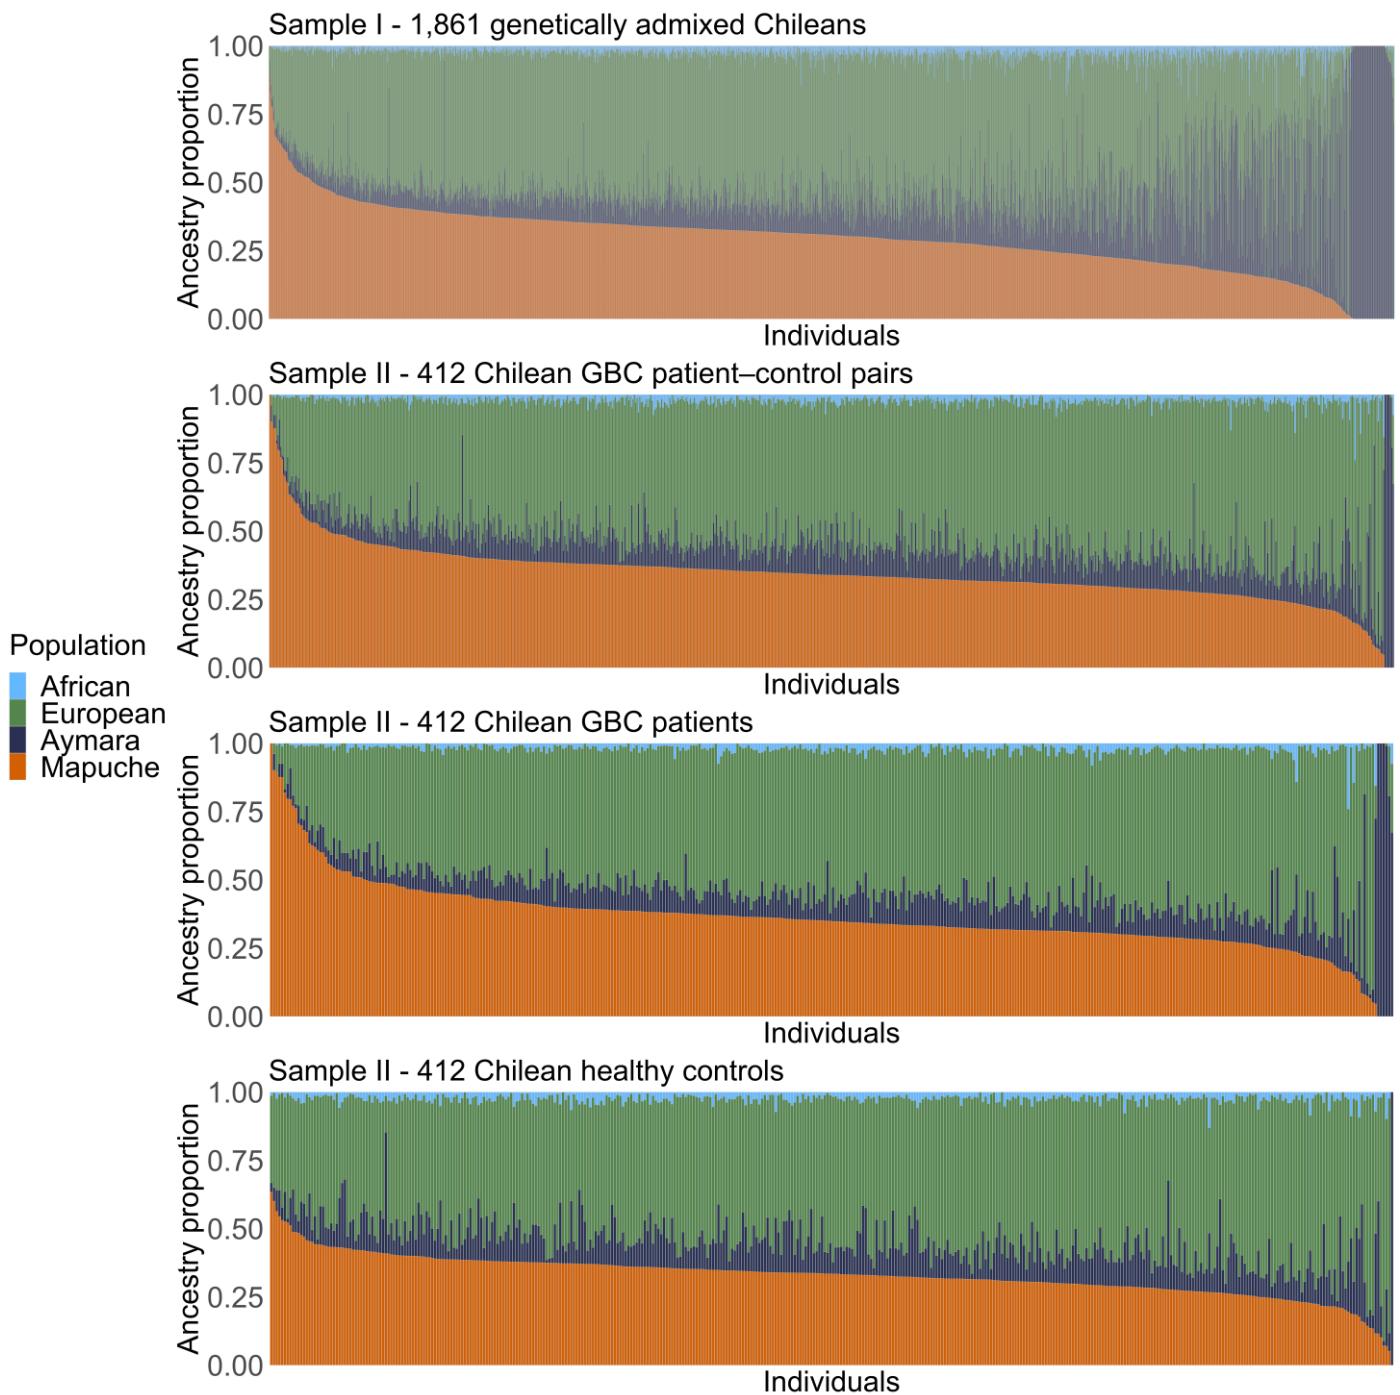

Outcome	Method	IV	Exp. Var.	$\beta/\text{OR}$	95% CI	$\beta$ <i>p</i> -Value	Q <i>p</i> -Value	Intercept <i>p</i> -Value
GBC	IVW	396	0.132	1.008	1.004	1.012	<b><math>6.7 \times 10^{-5}</math></b>	0.99
	Egger	396		1.009	0.991	1.028	0.33	0.99
	WM	396		1.009	1.004	1.015	<b><math>1.0 \times 10^{-3}</math></b>	0.87
Steiger filtering	IVW	266	0.095	1.004	1.000	1.009	0.06	0.99
LD $r^2 < 10^{-3}$	IVW	65	0.027	1.009	1.000	1.017	0.05	0.90
PheWAS $p < 5 \times 10^{-6}$	IVW	387	0.128	1.008	1.004	1.012	<b><math>2.7 \times 10^{-5}</math></b>	0.99
Gallstones disease	IVW	387	0.128	1.036	1.031	1.040	<b><math>1.9 \times 10^{-59}</math></b>	0.95
	Egger	387		1.031	1.010	1.052	<b><math>3.2 \times 10^{-3}</math></b>	0.95
	WM	387		1.032	1.025	1.039	<b><math>1.2 \times 10^{-21}</math></b>	0.65
BMI	IVW	390	0.128	-0.006	-0.009	-0.003	<b><math>5.0 \times 10^{-5}</math></b>	0.95
	Egger	390		-0.007	-0.021	0.006	0.30	0.95
	WM	390		-0.006	-0.011	-0.002	<b><math>7.0 \times 10^{-3}</math></b>	0.87

IV: Number of instrumental variables; Exp. Var.: variance explained by the instrumental variables;  $\beta/\text{OR}$ : estimated causal effect size for BMI/estimated causal odds ratio for GBC and gallstone disease per 1% increase in proportion of Mapuche ancestry; CI: confidence interval; Q: Cochran's Q statistic; Steiger filtering: additional Steiger filtering before linkage disequilibrium (LD) pruning of IV; IVW: Inverse variance weighted; Egger: MR-Egger; WM: Weighted median estimates; LD  $r^2 < 10^{-3}$ : more stringent thresholds for LD pruning; PheWAS  $p < 5 \times 10^{-3}$ : more stringent thresholds for genome wide association study (PheWAS). Bold type shows probability values smaller than 0.05.

**Supplementary Table S2.** Overview of the 50 genetic variants used as instrumental variables for Mendelian randomization analysis that explained the greatest variance in Mapuche ancestry proportion. The table shows the explained variance,  $I_n$  estimates for two subpopulations at a time (Mapuche–European, Mapuche–Aymara and Mapuche–African) and the minor allele frequencies (MAF) in the reference panels.

Genetic Variant	Variance Explained [%]	$I_n$ Mapuche-Aymara	$I_n$ Mapuche-European	$I_n$ Mapuche-African	MAF (Mapuche)	MAF (Aymara)	MAF (European)	MAF (African)

**Supplementary Figure S1.** Bar plot of the results from admixture analyses for individuals in Sample I and Sample II, as well as in sample II divided into GBC patients and healthy controls. The proportions of Mapuche, Aymara, European and African ancestry are shown in orange, dark blue, light green and light blue, respectively.
